

Representation of Medical Informatics in the Wikipedia and its Perspectives

Udo Altmann

**Institute of Medical Informatics,
Justus-Liebig-University, Gießen,
Germany**

Motivation

- „Daddy, what are you doing at work?“
- Questions from laymen regarding „oncology“ and „cancer registry“ topics
 - How can we transfer knowledge about our specialty to the public or specialists we are cooperating with (e.g. physicians)?
- Overwhelming results from internet searches
=> much information but often few knowledge
- Textbooks often cannot reflect new projects
 - How can we as members of a specialty (easily) get up to date information about off topics

Wikipedia – a possible solution?

- Wikipedia – free online encyclopedia
- Centralised resource with knowledge („versus“ scattered information as result from internet searches)
- Start January 2001
- 437086 entries in January 2005
(687,752 in August 2005)

Wiki

- Definition from the Wikipedia
 - A wiki is a web application that allows users to add content, as on an Internet forum, but also allows anyone to edit the content.
 - The name is based on the Hawaiian term wiki wiki, meaning “quick” or “informal”.
- Wikis gain increasing popularity
 - as tools for collaborative work

The Ideas Behind the Wikipedia

- “free encyclopedia that *anyone* can edit”
 - „easy low cost access to free knowledge to empower them [every single person] to do whatever it is that they want to do”
 - Collaboration of authors (including some kind of peer review)
 - Continuous improvement of articles
- Editing is simple and can easily be learnt
- Content available under the **GNU Free Documentation License**

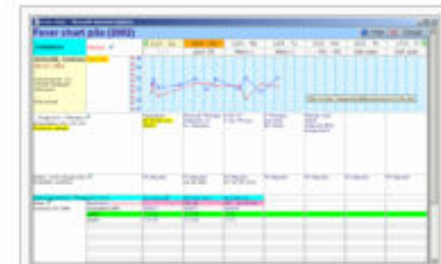

Medical informatics

From Wikipedia, the free encyclopedia.

Medical Informatics is the name given to the application of [information technology](#) to [healthcare](#). It is the:

"understanding, skills and tools that enable the sharing and use of information to deliver healthcare and promote health" (*British Medical Informatics Society*).

Medical informatics is often called [healthcare informatics](#) or [biomedical informatics](#), and forms part of the wider domain of *eHealth*. These later-generation terms reflect the substantive contribution of the citizen & non-medical professions to the generation and usage of healthcare data and related information. Additionally, medical informaticians are active in [bioinformatics](#) and other fields not strictly defined as health care.

Key Questions

■ General: Quality

- => Completeness
- => Correctness
- => Protection against vandalism / spam
- => Language: Understandability / neutral point of view

■ Specific: Medical Informatics

- => Coverage and quality of articles
- => Audience (laymen, specialists)

Methods

- Focus on coverage of topics
 - Sample (size: 57) of terms mainly from the table of contents of the "Handbook of Medical Informatics"
 - | Search on two days (October 17th, 2004 and January 2nd, 2005)
 - | Existence / date of entry
 - | Date of last Change
 - | Number of Changes
 - | Intensity of changes as index:
number of changes / (last change – date entered + 1)
 - not representative (what could be representative?)
 - | General „informatics“ topics
 - | Specific „medical informatics“ topics
- Introduction of new articles / modification of existing
 - What happens with new articles (improvements, vandalism, ...)?

Results I

- General "informatics" topics covered well
- Important rather specific "Medical Informatics" terms not found on first visit
 - *Nursing Informatics***
 - *Hospital Information System**, Clinical Information System
 - ICD-O, ICPM (=> *Medical Classification**)
 - Biosignal
 - Arden Syntax, Guideline (Medical Guideline Dec 18th, 2004)
 - Health Telematics
 - *Cancer Registry**
 - *: *entered by the author*
 - **: *entered + significant changes by other authors*

Results II

- Frequency of changes
 - Average one change / twenty days
 - High frequency on „Medical record“
- Quality of entries
 - Not the focus of this work
 - Sometimes too technical writing
 - No vandalism in this area
(but observed in other areas)
 - Some attempts to introduce advertisements
(Electronic Medical Record)

Discussion I

- Wikipedia general
 - Test by computer magazine (c't, Oct. 04)
 - | Overall comparable quality with respect to commercial products
(Microsoft Encarta Pro and Brockhaus, German version)
 - „Wikipedia might be completed in 10 years“
 - | Founder Jimmy Wales cited in a German newspaper
(Frankfurter Rundschau Aug. 06, 05)
- => The „Wikipedia“-idea works well

Discussion II

■ Wikipedia and Medical Informatics

- Not well represented
- Possible reasons
 - | low awareness of / few knowledge about the Wikipedia project in the Medical Informatics "community"
 - | no resources to contribute to the project
 - | Wikipedia not estimated as a possibility to transfer knowledge about Medical Informatics to the public

Discussion III

- Should Medical Informatics be presented in the Wikipedia?
- Yes
 - Public representation is an obligation of each „living“ science
 - Existing official MI websites are not suitable for broad public
 - Numerous sites are focused on specific projects
 - Search engines generally only assist with specific searches with some user knowledge about a topic
 - Wikipedia seems to evolve into THE central resource for knowledge search

NEWSFLASH

MIE2005 Geneva, 28 August-1 September 2005

Medical Informatics Europe (MIE) congress is the main scientific event in the medical informatics area to be held every two years out of three in Europe.

Its attendance amounts up to 1000 participants from 26 European member countries of the European Federation for Medical Informatics (EFMI). Several scientists from other parts of the world will also attend this event.

For more details please visit www.mie2005.net

18,000 GPs registered for care records

Thursday, 18 August 2005

The number of NHS staff registered to eventually use the national NHS Care Record becomes available, has trebled in the past two months and by the beginning of next month will reach 18,000.

Deutsche Gesellschaft für Medizinische Informatik, Biometrie und die Epidemiologie (GMDS)

Die GMDS hat es sich zum Ziel gesetzt, die Entwicklung der Medizinischen Informatik, Biometrie und die Epidemiologie zu fördern und die Forschung und Lehre zu unterstützen.

Die Internet-Präsentation der GMDS bietet Ihnen als zeitnahes Informationsmedium allen GMDS-Mitgliedern und sonstigen Interessenten Hinweise zum Geschehen in der Medizinischen Informatik, der Biometrie und der Epidemiologie zu geben.

International Medical Informatics Association

Welcome to IMIA!

IMIA's goals and objectives include

- the promotion of informatics in health care and biomedical research
- the advancement of international cooperation
- the stimulation of research, development and education
- the dissemination and exchange of information

Inherent in this mission is to bring together, from a global perspective, scientists, researchers, vendors, consultants and suppliers in an environment of cooperation and sharing. The international membership network of National Member Societies, IMIA Regions, Corporate and Academic Institutional Members, and our Working and Special Interest Groups that constitute the "IMIA family" is uniquely positioned to achieve these goals.

Discussion IV

- Which audience?
 - Laymen (general, understandable, few changes)
 - AND Specialists (more specific ...)
- Rule (from Wikipedia)
 - „When you do write articles, consider the audience in your writing. An article entitled "Use of chromatic scales in early Baroque music" is likely to be read by musicians, and so technical details and jargon are entirely appropriate. But an article entitled "Rap music" is likely to be read by laymen who want a brief and plainly written overview, with links to more detailed information if available.“

Discussion V

- How organise? Some ideas ...
 - Wikipedia work is grass root work
 - | => Raise awareness
 - Wikipedia work trains writing
 - | => Let students do the work
 - Wikipedia work is practised collaboration
 - | => that's we all talk about and that we need ...
 - Wikipedia software (WikiMedia) offers mechanisms to
 - | watch pages (e.g. track own contributions)
 - | discuss contents
 - | preserve history
 - | => protection and evolution towards better quality

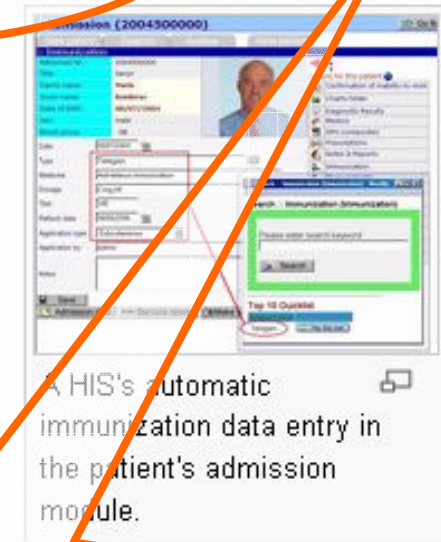

Aspects of the field

Is this all?

[\[edit\]](#)

These include:

- architectures for [electronic medical records](#) and other health information systems used for billing, scheduling or research.
- decision support systems in healthcare
- messaging standards for the exchange of information between health care information systems (e.g. through the use of the [HL7](#) data exchange standard) - these specifically define the *means* to exchange data, not the content
- controlled medical vocabularies such as the Standardized Nomenclature of Medicine, Clinical Terms (SNOMED-CT), Logical Observation Identifiers Names and Codes (LOINC) or [OpenGALEN](#) Common Reference Model - used to allow a standard, accurate exchange of data content between systems and providers
- use of hand-held or portable devices to assist providers with data entry, [software](#) in medical decision-making

So please,
edit!

[\[edit\]](#)

History

Medical informatics began in the [1950s](#) with the rise of useable computation devices, [computers](#).

Early names for medical informatics included medical computing, medical computer science, computer medicine, medical electronic data processing, medical automatic data processing, medical information processing, medical information science, medical software engineering and medical computer technology.

[article](#)[discussion](#)[edit this page](#)[history](#)[move](#)[unwatch](#)

Editing Medical informatics (section)

From Wikipedia, the free encyclopedia.

==Aspects of the field==

[[Image:immune_auto.jpg|thumb|right|A HIS's automatic immunization data entry in the patient's admission module.]]

These include:

- * architectures for [[electronic medical records]] and other health information systems used for billing, scheduling or research.
- * decision support systems in healthcare
- * messaging standards for the exchange of information between health care information systems (e.g. through the use of the [[HL7]] data exchange standard) - these specifically define the ''means'' to exchange data, not the content
- * controlled medical vocabularies such as the Standardized Nomenclature of Medicine, Clinical Terms (SNOMED-CT), Logical Observation Identifiers Names and Codes (LOINC) or [[OpenGALEN]] Common Reference Model - used to allow a standard, accurate exchange of data content between systems and providers.
- * use of hand-held or portable devices to assist providers with data entry/retrieval or medical decision-making

Conclusion

- Wiki is a technique for collaborative development of content
 - => easily to keep up-to-date
- Wikipedia is an online knowledge resource with increasing importance
- Medical Informatics should be better represented in the Wikipedia
- Small contributions by a significant proportion of teachers and students of Medical Informatics could improve the representation
